Web design Proposal

My website is for my own fake bakery brand, Cupcakeria. The index.html page will be all about my brand. The gallery page will have a slideshow with animations of all the desserts I offer. The last page will show a photo of a person and some information about my bakery brand. For my Web Design Final, I'm planning to keep some ideas from my midterm, like the Google Fonts, colors, images, and animations. The font for the headers is Kalnia Glaze and for the paragraphs I will use Sour Gummy. For the animation, I'll use a simple p5.js example animation of a shape. In addition, I want to make sure my code is organized and easy to read for the final, especially the navigation bar. I want to add some interactive features too. Using Query, I want to make an interactive subscribe/unsubscribe button when it's clicked. It will change to a darker pink color when clicked. I will try to change the mouse cursor to fit the aesthetic of my website. I also want users to be able to type their name or other input, and have it appear in the top corner of the page. The website will remember this user the next time they access the website. This type of jQuery is used for all websites because always make you sign up for their subscription services to sell something. In this case, I want to send updates of new desserts for customers to try, using a combination of javascript and jquery. For the gallery, I hope to make it interactive so that users can click on a dessert and it will pop up on the whole page. There will be the ingredients of the dessert on the side, so users can use it to see if they have any allergies. I will try to achieve completion of my final using p5.js, W3 Schools, and slides from class.
